

Sunday Morning

Health Corner

Why are Clinical Studies Important?

Clinical studies is research that help ensure drugs and treatments are safe and effective for human beings. Clinical studies is the process of finding cures to life-threatening diseases like HIV and Cancer.

African Americans participate in clinical studies at far lower rates than other ethnic groups, thus allowing the development of drug treatments that may or may not be effective for our bodies.

African-Americans differ genetically from other ethnicities so it's critical to participate in clinical studies to ensure medicines and treatments are designed for our bodies and genetic makeup.

Participating in clinical studies is necessary to eliminate health disparities and to create a healthier future for ourselves and our families.

Talk with your doctor today about clinical studies in your area and learn how you or someone you know can participate!
